R Visualization

My ggplot2 project

data visualization or charts

```
library(ggplot2)
library(dplyr)
```

```
##
## Attaching package: 'dplyr'

## The following objects are masked from 'package:stats':
##
##   filter, lag

## The following objects are masked from 'package:base':
##
##   intersect, setdiff, setequal, union
```

```
base <- ggplot(data = diamonds,
               mapping = aes(x = price))

base + geom_histogram(bins = 10)
```

```
base + geom_density()
```

Mapping (MAp data from dataframe into chart)

```
base <- ggplot(data = diamonds,  
  mapping = aes(x = price))
```

.### Setting (Set format)

```
base + geom_histogram(bins = 50,  
  fill = "pink",  
  color = "blue")
```

one variable, non-number factor

```
base2 <- ggplot(data = diamonds,  
                 mapping = aes(x = cut))
```

```
base2 +  
  geom_bar(mapping = aes(fill = cut))
```

two variables, number x number

```
small_dia <- diamonds %>%  
  sample_n(5000)  
  
ggplot(data = small_dia,  
       mapping = aes(x = price, y = carat)) +  
  geom_point(alpha = 0.5, shape = "x",  
            mapping = aes(color = cut)) +  
  theme_dark()
```

add more variables

```
ggplot(diamonds,  
  aes(carat, price)) +  
  geom_point(aes(color = clarity,  
    shape = cut),  
    size = 1) +  
  theme_minimal()
```

Warning: Using shapes for an ordinal variable is not advised

Multiple chart in one + add title

```
ggplot(mtcars %>%
  filter(hp < 130, mpg > 16),
  aes(hp, mpg)) +
  geom_point() + ## chart 1
  geom_smooth(method = "lm") + ## chart 2
  labs(title = "Scatter plot HP x MPG",
    subtitle = "Positive relationship between two factor",
    caption = "Data Source : mtcars dataframe",
    x = "horse power",
    y = "mile per galion")
```

```
## `geom_smooth()` using formula = 'y ~ x'
```

Scatter plot HP x MPG

Positive relationship between two factor

Data Source : mtcars dataframe

faceting breaks down big chart

```
ggplot(diamonds %>% sample_n(1500),  
  aes(x = carat, y = price)) +  
  geom_point(color = "red", alpha = 0.5) +  
  facet_wrap(~color, ncol = 7)
```

Box plot

```
ggplot(diamonds %>% sample_n(1000),
  aes(y = cut, x = price)) +
  geom_boxplot()
```

Violin plot

```
ggplot(diamonds %>% sample_n(1000),
  aes(x = cut, y = price)) +
  geom_violin()
```

Multiple data set

```
## Set1
premium_di <- diamonds %>%
  filter(cut == "Premium") %>%
  sample_n(500)
## Set2
good_di <- diamonds %>%
  filter(cut == "Good") %>%
  sample_n(500)

ggplot() +
  geom_point(data = premium_di,
            mapping = aes(carat, price),
            color = "red") +
  geom_point(data = good_di,
            mapping = aes(carat, price),
            color = "green") +
  theme_minimal()
```

Manual change color

```
diamonds %>%  
  ggplot(aes(carat, price)) +  
  geom_point() +  
  theme_minimal() +  
  scale_fill_manual(values = c(  
    "#ff4d4d",    ## hex color  
    "#ffaf5e",  
    "#ff8e5e",  
    "#ff735e",  
    "#ff5e79"  
  ))
```
